### Determinant of a Matrix

Satya Mandal, KU

13 March 2018

## Goals

- We will define determinant of SQUARE matrices, inductively, using the definition of Minors and cofactors.
- ▶ We will see that determinant of triangular matrices is the product of its diagonal elements.
- Determinants are useful to compute the inverse of a matrix and solve linear systems of equations (Cramer's rule).

Determinant of  $1\times 1$  and  $2\times 2$  matrices Minors and Cofactors of  $3\times 3$  matrices Determinant of  $3\times 3$  matrices Determinant, Minors and Cofactors of all square Matrices Minors of  $n\times n$  Matrices Triangular Matrices Determinant of triangualr matrices

### Overview of the definition

- ▶ Given a square matrix A, the determinant of A will be defined as a scalar, to be denoted by det(A) or |A|.
- ▶ We define determinant inductively. That means, we first define determinant of 1 × 1 and 2 × 2 matrices. Use this to define determinant of 3 × 3 matrices. Then, use this to define determinant of 4 × 4 matrices and so.

Determinant of tirangualr matrices

### Determinant of $1 \times 1$ and $2 \times 2$ matrices

- ▶ For a  $1 \times 1$  matrix A = [a] define det(A) = |A| = a.
- ▶ Let

$$A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$
 define  $det(A) = |A| = ad - bc$ .

Determinant of tirangualr matrices

# Example 1

Let

$$A = \begin{pmatrix} 2 & 17 \\ 3 & -2 \end{pmatrix}$$
 then  $det(A) = |A| = 2*(-2)-17*3 = -53$ 

Determinant of tirangualr matrices

# Example 2

Let

$$A = \begin{pmatrix} 3 & 27 \\ 1 & 9 \end{pmatrix}$$
 then  $det(A) = |A| = 3 * 9 - 1 * 27 = 0$ .

### Minors of $3 \times 3$ matrices

Let

$$A = \left(\begin{array}{ccc} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{array}\right)$$

Then, the **Minor**  $M_{ij}$  of  $a_{ij}$  is defined to be the determinant of the  $2 \times 2$  matrix obtained by deleting the  $i^{th}$  row and  $j^{th}$  column.

Determinant of  $1\times 1$  and  $2\times 2$  matrices Minors and Cofactors of  $3\times 3$  matrices Determinant of  $3\times 3$  matrices Determinant, Minors and Cofactors of all square Matrices Minors of  $n\times n$  Matrices Triangular Matrices Determinant of tirangualr matrices

### For example

$$M_{22} = \begin{vmatrix} a_{11} & a_{13} \\ & & \\ a_{31} & a_{33} \end{vmatrix} = \begin{vmatrix} a_{11} & a_{13} \\ a_{31} & a_{33} \end{vmatrix}$$

#### Like wise

$$M_{11} = \left| \begin{array}{cc} a_{22} & a_{23} \\ a_{32} & a_{33} \end{array} \right|, M_{23} = \left| \begin{array}{cc} a_{11} & a_{12} \\ a_{31} & a_{32} \end{array} \right|, M_{32} = \left| \begin{array}{cc} a_{11} & a_{13} \\ a_{21} & a_{23} \end{array} \right|.$$

### Cofactors of $3 \times 3$ matrices

Let A the  $3 \times 3$  matrix as in the above frame. Then, the **Cofactor**  $C_{ij}$  of  $a_{ij}$  is defined, by some sign adjustment of the minors, as follows:

$$C_{ij} = (-1)^{i+j} M_{ij}$$

For example, using the above frame

$$C_{11} = (-1)^{1+1} M_{11} = M_{11} = a_{22} a_{33} - a_{23} a_{33}$$

$$C_{23} = (-1)^{2+3} M_{23} = -M_{23} = -(a_{11} a_{32} - a_{12} a_{31})$$

$$C_{32} = (-1)^{3+2} M_{32} = -(a_{11} a_{23} - a_{13} a_{21}).$$

Determinant of  $1\times 1$  and  $2\times 2$  matrices Minors and Cofactors of  $3\times 3$  matrices Determinant of  $3\times 3$  matrices Determinant, Minors and Cofactors of all square Matrices Minors of  $n\times n$  Matrices Triangular Matrices Determinant of triangualr matrices

### Determinant of $3 \times 3$ matrices

Let A be the  $3 \times 3$  matrix as above. Then the **determinant** of A is defined by

$$\det(A) = |A| = a_{11}C_{11} + a_{12}C_{12} + a_{13}C_{13}$$

This definition may be called "definition by expansion by cofactors, along the first row". It is possible to define the same by expansion by second of third row, which we will be discussed later.

Determinant of  $1\times 1$  and  $2\times 2$  matrices Minors and Cofactors of  $3\times 3$  matrices Determinant of  $3\times 3$  matrices Determinant, Minors and Cofactors of all square Matrices Minors of  $n\times n$  Matrices Triangular Matrices

Determinant of tirangualr matrices

# Example 3

Let

$$A = \left| \begin{array}{ccc} 2 & 1 & 1 \\ 3 & -2 & 0 \\ -2 & 1 & 1 \end{array} \right|$$

Compute the minor  $M_{11}$ ,  $M_{12}$ ,  $M_{13}$ , the cofactors  $C_{11}$ ,  $C_{12}$ ,  $C_{13}$  and the determinant of A.

Determinant of  $1\times 1$  and  $2\times 2$  matrices Minors and Cofactors of  $3\times 3$  matrices Determinant of  $3\times 3$  matrices Determinant, Minors and Cofactors of all square Matrices Minors of  $n\times n$  Matrices Triangular Matrices

Determinant of tirangualr matrices

### Solution:

Then minors

$$M_{11} = \left| \begin{array}{cc} -2 & 0 \\ 1 & 1 \end{array} \right|, M_{12} = \left| \begin{array}{cc} 3 & 0 \\ -2 & 1 \end{array} \right|, M_{13} = \left| \begin{array}{cc} 3 & -2 \\ -2 & 1 \end{array} \right|$$

Or

$$M_{11} = -2$$
,  $M_{12} = 3$ ,  $M_{13} = -1$ 

Determinant of  $1\times 1$  and  $2\times 2$  matrices Minors and Cofactors of  $3\times 3$  matrices Determinant of  $3\times 3$  matrices Determinant, Minors and Cofactors of all square Matrices Minors of  $n\times n$  Matrices Triangular Matrices Determinant of triangualr matrices

### Continued

So, the cofactors

$$C_{11} = (-1)^{1+1} M_{11} = -2, \quad C_{12} = (-1)^{1+2} M_{12} = -3,$$

$$C_{13} = (-1)^{1+3} M_{13} = -1$$

So,

$$|A| = a_{11}C_{11} + a_{12}C_{12} + a_{13}C_{13} = 2*(-2) + 1*(-3) + 1*(-1) = -8$$

## Inductive process of definition

- ▶ We defined determinant of size  $3 \times 3$ , using the determinant of  $2 \times 2$  matrices.
- Now we can do the same for 4 × 4 matrices. This means first define minors, which would be determinant of 3 × 3 matrices. Then, define Cofactors by adjusting the sign of the Minors. Then, use the cofactors fo define the determinant of the 4 × 4 matrix.
- ► Then, we can define minors, cofactors and determinant of 5 × 5 matrices. The process continues.

Determinant of 3 × 3 matrices Determinant, Minors and Cofactors of all square Matrices Minors of  $n \times n$  Matrices Triangular Matrices Determinant of tirangualr matrices

### Minors of $n \times n$ Matrices

We assume that we know how to define determiant of  $(n-1)\times(n-1)$  matrices. Let

$$A = \begin{pmatrix} a_{11} & a_{12} & a_{13} & \cdots & a_{1n} \\ a_{21} & a_{22} & a_{13} & \cdots & a_{2n} \\ a_{31} & a_{32} & a_{33} & \cdots & a_{3n} \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ a_{n1} & a_{n2} & a_{n3} & \cdots & a_{nn} \end{pmatrix}$$

be a square matrix of size  $n \times n$ . The **minor**  $M_{ii}$  of  $a_{ii}$  is defined to be the determinant of the  $(n-1) \times (n-1)$  matrix obtained by deleting the  $i^{th}$  row and  $j^{th}$  column.

## Cofactors and Detarminant of $n \times n$ Matrices

Let A be a  $n \times n$  matrix.

Define

$$C_{ij} = (-1)^{i+j} M_{ij}$$
 which is called the **cofactor** of  $a_{ij}$ .

Define

$$det(A) = |A| = \sum_{j=1}^{n} a_{1j} C_{1j} = a_{11} C_{11} + a_{12} C_{12} + \cdots + a_{1n} C_{1n}$$

This would be called a definition by expasion by cofactors, along first row.

Determinant of  $1\times 1$  and  $2\times 2$  matrices Minors and Cofactors of  $3\times 3$  matrices Determinant of  $3\times 3$  matrices Determinant, Minors and Cofactors of all square Matrices Minors of  $n\times n$  Matrices Triangular Matrices

Determinant of tirangualr matrices

### Alternative Method for $3 \times 3$ matrices:

$$A = \left(\begin{array}{ccc} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{array}\right)$$

Form a new  $3 \times 5$  matrix by adding first and second column to A:

$$a_{11}$$
  $a_{12}$   $a_{13}$   $a_{11}$   $a_{12}$   
 $a_{21}$   $a_{22}$   $a_{23}$   $a_{21}$   $a_{22}$   
 $a_{31}$   $a_{32}$   $a_{33}$   $a_{31}$   $a_{32}$ 

Determinant of  $1\times 1$  and  $2\times 2$  matrices Minors and Cofactors of  $3\times 3$  matrices Determinant of  $3\times 3$  matrices Determinant, Minors and Cofactors of all square Matrices Minors of  $n\times n$  Matrices Triangular Matrices Determinant of tirangual matrices

### Continued

Then |A| can be computed as follows:

- add the product of all three entries in the three left to right diagonals.
- add the product of all three entries in the three right to left diagonals.
- ▶ Then, |A| is the difference.

Determinant of  $1\times 1$  and  $2\times 2$  matrices Minors and Cofactors of  $3\times 3$  matrices Determinant of  $3\times 3$  matrices Determinant, Minors and Cofactors of all square Matrices Minors of  $n\times n$  Matrices Triangular Matrices

Determinant of tirangualr matrices

### Definition.

#### **Definitions.** Let A be a $n \times n$ matrix.

- ▶ We say A is Upper Triangular matrix, all entries of A below the main diagonal (left to right) are zero. In notations, if  $a_{ij} = 0$  for all i > j.
- We say A is Lower Triangular matrix, all entries of A above he main diagonal (left to right) are zero. In notations, if  $a_{ii} = 0$  for all i < j.

Determinant of  $1\times 1$  and  $2\times 2$  matrices Minors and Cofactors of  $3\times 3$  matrices Determinant of  $3\times 3$  matrices Determinant, Minors and Cofactors of all square Matrices Minors of  $n\times n$  Matrices Triangular Matrices Determinant of tirangualr matrices

### **Theorem**

**Theorem** Let A be a triangular matrix of order n. Then |A| is product of the main-diagonal entries. Notationally,

$$|A|=a_{11}a_{22}\cdots a_{nn}.$$

**Proof.** The proof is easy when n = 1, 2. We prove it when n = 3. Let use assume A is lower triangular. So,

$$A = \left(\begin{array}{ccc} a_{11} & 0 & 0 \\ a_{21} & a_{22} & 0 \\ a_{31} & a_{32} & a_{33} \end{array}\right)$$

### Continued

We expand by the first row:

$$|A| = a_{11}C_{11} + 0C_{12} + 0C_{13} = a_{11}C_{11}$$
  
=  $a_{11}(-1)^{1+1}\begin{vmatrix} a_{22} & 0 \\ a_{32} & a_{33} \end{vmatrix} = a_{11}a_{22}a_{33}$ 

For upper triangular matrices, we can prove similarly, by column expansion. For higher order matrices, we can use mathematical induction.

## Example

Compute the determiant, by expansion by cofactors, of

$$A = \left(\begin{array}{ccc} 2 & -1 & 3 \\ 1 & 4 & 4 \\ 1 & 0 & 2 \end{array}\right)$$

#### Solution.

▶ The cofactors

$$C_{11} = (-1)^{1+1} \begin{vmatrix} 4 & 4 \\ 0 & 2 \end{vmatrix} = 8, C_{12} = (-1)^{1+2} \begin{vmatrix} 1 & 4 \\ 1 & 2 \end{vmatrix} = 2$$

$$C_{13} = (-1)^{1+3} \left| \begin{array}{cc} 1 & 4 \\ 1 & 0 \end{array} \right| = -4$$

▶ So, 
$$|A| = a_{11}C_{11} + a_{12}C_{12} + a_{13}C_{13} =$$

$$2*8+(-1)*2+3*(-4)=2$$

## Example

Let 
$$A = \begin{pmatrix} 3 & 7 & -3 & 13 \\ 0 & -7 & 2 & 17 \\ 0 & 0 & 4 & 3 \\ 0 & 0 & 0 & 5 \end{pmatrix}$$
 Compute  $det(A)$ .

**Solution.** This is an upper triangular matrix. So, |A| is the product of the diagonal entries. So

$$|A| = 3 * (-7) * 4 * 5 = -420.$$

# Example

Solve 
$$\begin{vmatrix} x+3 & 1 \\ -4 & x-1 \end{vmatrix} = 0$$

Solution. So,

$$(x+3)(x-1) - 1 * (-4) = 0$$
 or  $x^2 + 2x + 1 = 0$   
 $(x+1)^2 = 0$  or  $x = -1$ .
